Question 1

1.1) LMN follows the P2P (procure to pay) process which manages the procurement of goods and payment to suppliers. This process starts when LMN textiles determine that fabrics and dyes need to be purchased from various vendors. This is approved and converted into a purchase order sent to suppliers, and this process ends when product has been delivered and paid for.

Connection to supplier activities

As vendors receive purchase orders from LMN textiles they prepare the required materials

Vendors receive and fulfill the purchase order and issue an invoice with delivery of fabrics and dyes to LMN textiles

LMN textiles receive goods and they verify that the goods received are in accordance with requested goods in purchase order and they verify that the issued invoice accounts only for goods requested before processing a payment to vendors.

1.2) BPM principles AfricaTimbers can apply;

1)Process Orientation – by modelling the end-to-end P2P process, AfricaTimbers can identify bottlenecks (approval delays, invoice mismatches) across departments and consult stakeholders.

Use of technology (Automation) - by streamlining approvals and applying automatic matching of purchase orders, receipts, and invoices. AfricaTimbers can reduce delays and mismatches.

Continuous Improvement – by regularly reviewing and refining the P2P processes AfricaTimbers can eliminate inefficiencies before they occur and build trust with suppliers.

Monitor and control – by assigning process ownership AfricaTimbers can ensure accountability for stakeholders of P2P to ensure faster issue resolution and improve strained relationships.

Standardization – By enforcing consistent procedures for purchase orders, invoicing, and approvals AfricaTimbers can Standardize P2P rules and reduce errors leading to good collaboration with suppliers ensuring set of standards are clearly understood on both sides resolving inefficiencies legally.

1.3) The Issue-to-Resolution process applies here, starting when a customer raises a complaint and ending when both parties agree the issue is solved. In the South African bank case, this has not happened.

1.4) The Application-to-Approval process applied in the SASSA scenario starts when an applicant submits/applies for a social grant and ends when the social grant in question is either granted or denied.

By manually checking all the paperwork for all applicants, SASSA experienced inefficiencies in their A2A process causing delays in processing social grant applications. To improve this SASSA can apply the following two BPM principles;

- Use of technology (Automation) - Implement automated processing and verification for applicants with complete paperwork. Reduces manual checks, errors, and processing delays.

-Process Improvement – by simplifying approval steps (fewer checks, docs) and implementing clear timelines and responsibilities (SLAs). SASSA can ensure faster approvals and an efficient Application-to-Approval process.

Question 2

2.1)

- A Business Process is a structured series of related activities, decisions, and events that are performed to achieve a specific organizational goal and deliver value. (e.g., MediCare Hospital's equipment request process is performed with events, activities, and decisions that lead to business receiving essential equipment to perform main functionality which delivers medical services.
- Business Process Management (BPM) is the approach of managing, monitoring, continuously improving and ensuring business processes managed holistically for consistent value delivery.

MediCare's equipment request process qualifies as a Business Process because;

- It includes a sequence of activities such as (requesting equipment, approval, procurement, and delivery.
- It has a start (request submission) and end (equipment is delivered), and it adds value by ensuring that the hospital has the necessary equipment to provide quality patient care.

2.2) The three key ingredients of a process;

1)Actors – are the people involved in performing activities and delivering value or receiving value within a business process, In the MediCare case study, the actors include doctors, administrative staff and the hospital director.

Doctors request equipment for surgeries; administrative staff handle and process the requests, and the hospital's director may approve. These actors work together to ensure that the process delivers value.

2)Physical objects- are the resources used to perform activities within a business process. In the MediCare the physical objects are medical equipment required for surgeries. These items are essential for completing medical procedures, and their availability impacts the healthcare delivered to patients.

3)Activities (Business process tasks) – Activities refer to the set of tasks performed to transform inputs into outputs that deliver value. In the MediCare hospital case study, the activities include submitting equipment requests, reviewing and approving requests, procuring equipment, and delivering it for use in surgeries. These activities form the equipment request process which provides doctors with the tools to effectively deliver patient care.

2.3) The Actors involved in the equipment request process;

Internal actors

-Doctors are responsible for requesting the necessary medical equipment required for surgeries and other procedures. Their role is critical as they initiate the process by requesting the resources needed to effectively deliver patient care.

-Administrative staff are responsible for processing and managing equipment requests. In the MediCare case study, this process is handled manually, which leads to inefficiencies and delays in approvals and procurement.

-Hospital director, is responsible for approving equipment requests and overseeing the process to ensure it operates efficiently and delivers consistent value, the hospital director plays a key role in critical decision making and process control.

External actors

-Suppliers are the ones who supply and deliver the requested medical equipment to the hospital. They respond to procurement requests and ensure that the hospital receives the necessary resources, usually in exchange for payment.

-Patients are the recipients of healthcare services, they are not directly involved in the process steps, but they are key stakeholders as the availability of equipment directly impacts the quality and timeliness of their treatment.

2.4) Outcomes of MediCare equipment request process

Positive Outcome - Doctors receive the critical equipment required to perform surgeries and other procedures. This enables them to deliver effective and timely patient care, which adds value to both the hospital and patients.

Negative Outcome; The manual handling of requests and approvals leads to inefficiencies and delays in processing equipment requests. As a result, doctors may not receive equipment on time, which can negatively impact the quality and timeliness of patient care.

2.5) How BPM can optimize the equipment request

Business Process Management (BPM) can optimize the equipment request process by analyzing, redesigning, and continuously improving the steps involved in requesting, approving, and delivering medical equipment. By focusing on the process as a whole, BPM helps to identify inefficiencies and eliminate unnecessary steps.

In the MediCare Hospital case, BPM can streamline the workflow by ensuring that each step in the equipment request process is efficient and effectively monitored for performance. this leads to faster processing times and improved service delivery

A key improvement would be to introduce an automated digital approving system instead of manually handling requests, this would reduce delays, minimize errors and improve overall efficiency.

Question 3

3.1) Selection Criteria

1)**Strategic importance** – evaluating how important a particular process is in the overall, if it is those processes that have the greatest strategic impact overall that should be considered for evaluation

2)**Health** –based on selecting those processes that are the most inefficient and infect would benefit from the improvement exercise

3)**Feasibility** – is about assessing how practical or reasonable it would be to revamp a specific business process

Davenport suggests organizations should prioritize processes that;

- have a large amount of strategic importance

- are poor/low in health

-Offer significant performance improvement impact

-and avoid processes that are performing well, even if they are easy to improve

These three-selection criteria form input to what is known as the process portfolio provided in the case study and analyzed further below with Davenports best practices consideration;

Process	strategic importance	Health	feasibility	Analysis	Davenports best practices
Patient Registration	High - this is the first point of contact and directly affects patient experience and service delivery	Low - indicates inefficiencies such as delays and errors	Medium - improvements may require moderate effort and system changes	This process is highly critical and currently underperforming making it strong consideration for improvement despite moderate feasibility	Aligns the strongest with davenports recommendation (to prioritize high importance + low health first)
Appointment Scheduling:	Medium – important for business operations but not as critical as patient registration	High – the process is already performing well	High – easy to improve, but improvements have limited benefits	This process is already healthy and improving a process which provides low return on investment should not be prioritized	Does not align with davenports recommendations due to high health which davenport best advises to not consider
Medical Records Management:	Medium – important for compliance and internal operations	Low – indicates inefficiencies or risks	High – easy to improve	This process is a good improvement consideration due to low health and high	Partially aligns because of low health but lacks high strategic importance

				feasibility, but it's moderate Strategic importance makes it less urgent than patient registration.	to be prioritized first
--	--	--	--	--	----------------------------

Conclusion and recommendation

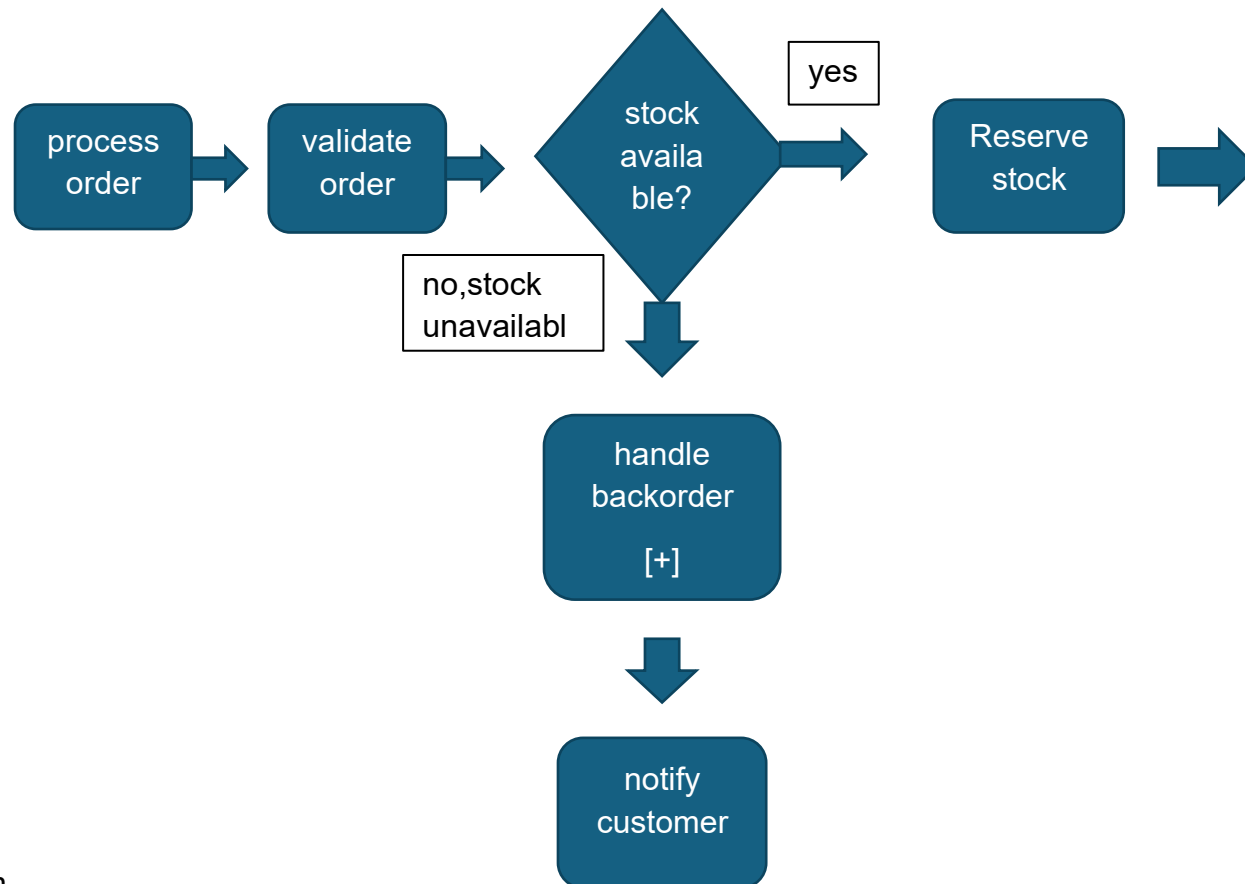

HeathPlus Clinics should prioritize the patient registration process for improvement first because it has high strategic importance, it has low health indicating that there is an urgent need for improvement and because the impact of improvement will be more significant than the effort required.

And based on the evaluation of davenports best practices, the patient registration process is the most appropriate process to improve first.
